

Quick Start

Safe first-run workflow for live capture and sanitized PCAP replay

Version	1.4.0-beta.2
Community license	GPL-3.0-or-later
Platform	Windows 10/11 x64
Product boundary	Receive-only; no SV/GOOSE publishing or IEC 61850 control commands

This document describes engineering use and evidence boundaries. It is not a certificate of IEC 61850 conformance, calibrated timing, functional safety, cybersecurity approval, equipment isolation, or switching authority.

1. Prepare the engineering workstation

- Use Windows 10 or Windows 11 x64 and install Npcap separately when live raw Ethernet capture is required.
- Use an authorized TAP, mirror port, or isolated engineering test switch. Do not insert an unverified workstation into a protection-critical path.
- Avoid Wi-Fi, VPN, virtual, loopback, and unverified USB adapters for serious arrival-timing interpretation.

2. Verify and run the package

- Verify the ZIP against SHA256SUMS.txt and review release-manifest.json, SOURCE.md, and sbom.cdx.json.
- Extract the package to a local folder and run ProcessBusInsight.exe.
- Open About and confirm the displayed version and build commit match the package evidence.

3. Capture or replay

- Select the intended physical adapter before starting capture.
- Confirm SV, GOOSE, and PTP evidence appears only from the expected observation point.
- Use sanitized classic Ethernet PCAP replay for reproducible offline investigation. PCAPNG is not currently claimed.

4. Record scoped evidence

- Record adapter, capture path, APPID, VLAN, MAC, svID or GOOSE identity, timestamp source, SCL expectation, and observed field.
- Keep configured expectation, observed traffic, software interpretation, and external-device response separate.
- Treat ordinary Windows/Npcap timing as screening evidence unless independently validated with suitable hardware and procedures.
